Professional Summary

Data Engineer with hands-on experience in designing and developing end-to-end ETL pipelines across on-premise and cloud platforms. Skilled in data ingestion, cleansing, transformation, and monitoring, with a strong focus on building scalable, automated, and traceable data systems. Experienced in orchestrating workflows using Apache Airflow on Docker running on Google Cloud Platform (GCP), with automated email alert systems for pipeline health monitoring.

Proficient in working with SQL, Python, Shell Script, and C#, with practical experience in MongoDB, PostgreSQL, and Azure Functions for ETL deployment. Also conducted a Proof of Concept on Azure Databricks for cost and feasibility assessment of cloud migration.

In addition, developed a Machine Learning project for gold price prediction, demonstrating solid skills in data modeling, feature engineering, and evaluation using algorithms such as ANN and Lasso Regression.

Technical Skills

Programing language

SQL, Python, Shell script(Unix), NoSQL, C#, PL/SQL

Databases

PostgreSQL, Greenplum, Oracle, MongoDB

Big Data & Analytics Tools

Cloudera Data Platform, Hue, Cloudera Impala, Apache Hive, Azure Databricks, Power BI (DAX)

Workflow & Orchestration

Docker, Apache Airflow

Work Experience

Data Engineer | Product & Development
Creden Asia Co., Ltd.

Aug. 2025 - Nov. 2025

Role Overview

Responsible for designing and managing end-to-end ETL pipelines, including data ingestion from external APIs, data cleansing and validation, loading into MongoDB and PostgreSQL, with logging and automated alert systems. All pipelines are executed via Airflow on Docker (deployed on GCP VM), with full responsibility for infrastructure, Docker Compose, and email monitoring, and exporting data for reporting as CSV files on Cloud Storage.

Key Responsibilities

- Developed and optimized data ingestion processes from multiple data sources, including government APIs, websites, and internal systems.
- Performed data cleansing and transformation to ensure data quality and readiness for business use.
- Designed and implemented end-to-end ETL systems for extracting, transforming, and loading data into MongoDB and PostgreSQL.
- Built and maintained data pipelines with comprehensive logging for traceability and automated email notification systems for monitoring and alerts.
- Designed and documented scalable and maintainable data pipelines and workflows.

Data Engineer | Data Warehouse Team
PP&P Advance Co., Ltd. | Outsource Mimo Tech Co., Ltd. (Subsidiary of AIS)

Jun. 2024 - Jul. 2025

Role Overview

Responsible for developing and managing ETL processes on on-premise systems, preparing data for analytics and campaign operations. Ingested and transformed data from Data Lake and Data Warehouse into a Data Mart, with bi-directional transfers between cloud and on-premise environments. Conducted a Proof of Concept for migrating processes to Azure Databricks using PySpark to evaluate cost and feasibility.

Key Responsibilities

- Developed ETL processes on On-Premise systems to prepare data for teams to use in analytics and to support campaign operations.
- Ingested data from both Data Lake and Data Warehouse into a Data Mart, and managed bi-directional data transfers between cloud and on-premise environments.
- Analyzed, resolved, and improved processes based on system issues (Issue Analysis and Resolution).
- Developed data monitoring scripts and implemented an automated email notification system.
- Cleansed unnecessary data from the database to enhance processing performance and overall system efficiency.
- Conducted a Proof of Concept (POC) for migrating processes from On-Premise to On-Cloud (Azure Databricks) using PySpark to assess the cost and feasibility of migration.

Internship

Assistant Data Analytics Professional | Channel Service
A-HOST Co., Ltd.

Nov. 2023 - Mar. 2024

- Create a script for the ETL process and deploy it to Azure Functions to load data into Azure Blob Storage using C#.
- Create a script to categorize JSON files fetched from an API into categories for easy file retrieval, using Python.
- Check the business logic in the Macro script and compile the information into a document to serve as a guide for pipeline implementation.
- System Integration Testing (SIT) Reconcile ensures the accuracy of the information to be 100%.

Project

Gold Price Prediction Using Machine Learning on Flattened Time Series Data

Oct. 2023

- Designed and implemented predictive models for daily gold price forecasting using multiple machine learning algorithms, including Artificial Neural Network (ANN), Lasso Regression, Linear Regression, Random Forest Regression, and Decision Tree Regression.
- Conducted experiments on different time windows (7-day, 14-day, and 30-day historical time series datasets) to evaluate the impact of input size on prediction accuracy; the 7-day dataset consistently outperformed the others.
- Achieved the lowest Mean Absolute Error (MAE) using Lasso Regression trained on the 7-day dataset, indicating strong short-term forecasting capabilities.
- Built and tested a 3-layer Artificial Neural Network model which, when applied to a simulated trading strategy, generated the highest returns among all models tested.

Education

- Rajamangala University of Technology Suvarnabhumi
Faculty of Science and Technology, Major in Data Science Management | GPA 3.26

2024
- Pramaesakolsongkroh school
Science-Mathematics

2020
